5. Deleting Tags in WordPress

Tagging your WordPress posts with specific keywords allows you to categorise content and makes SEO much more comfortable. Tags are an optional but powerful tool for helping readers discover related content across your site.

1. What Are WordPress Tags?

WordPress Tags are a set of keywords you can attach to your content to categorise and better identify posts. Each post can have many tags, and visitors can click on any tag to instantly find all related posts sharing that same tag.

Tags differ from Categories — they are more specific and descriptive keywords. Tags help readers find related content and improve SEO and search discoverability. Unlike categories, tags have no hierarchy — they are all at the same level. Tags are optional; posts can be published without any tags.

2. How to Include Tags in Your WordPress Post?

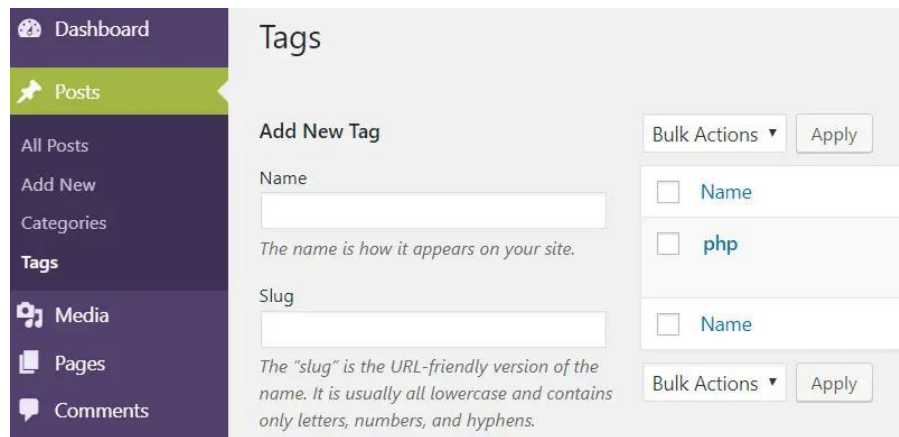

Follow these steps to create and add new tags in WordPress:

- 1 **Log in** — Sign in to your WordPress admin account.
- 2 **Navigate to Tags** — Go to Posts > Tags from the Admin Sidebar Menu.
- 3 **Tags Page** — A new screen — the Tags management page — will open.

4 Fill in Fields — Complete the Name, Slug, and Description fields (see Section 3).

5 Add Tag — Click the "Add New Tag" button to save the tag.

6 Confirm — The new tag appears immediately on the right side of the screen.

WordPress Admin — Posts > Tags — Add New Tag form and existing tags list

3. Tag Fields — Components

When creating or editing a tag, you will see the following fields:

Field	Description
Name	A unique name for the tag — this is how it appears on your site and in tag clouds.
Slug	The URL-friendly version of the tag name, used in the tag archive web address.
Description	Optional — a brief description of the tag, which some themes may display on tag archive pages.

Slugs are auto-generated but can be customised. They must be all lowercase with hyphens instead of spaces.

Tag names should be concise and descriptive keywords relevant to the post content.

Descriptions are optional but useful for themes that display tag archive introductions.

4. Editing Tags in WordPress

Follow these steps to edit an existing tag:

- 1 Go to Posts** — Navigate to Posts in the Admin Sidebar Menu.
- 2 Choose Tags** — Select the Tags option from the Posts submenu.
- 3 Find Your Tag** — Locate the tag you want to edit in the list.
- 4 Hover** — Move your mouse cursor over the tag name to reveal action links.
- 5 Select Edit** — Choose Edit for the full editor or Quick Edit for rapid inline changes.
- 6 Save** — Modify the desired fields and click the Update button to save changes.

Edit opens the full tag editor — update name, slug, and description.
Quick Edit provides a fast inline form for changing name and slug only.
Changes take effect immediately after clicking Update.

5. Deleting Tags in WordPress

To permanently remove a tag, follow these steps:

- 1 Go to Posts** — Navigate to Posts in the Admin Sidebar Menu.
- 2 Choose Tags** — Select the Tags option from the Posts submenu.
- 3 Find the Tag** — Locate the tag you wish to delete in the list.
- 4 Hover** — Move your mouse over the tag name to reveal action links.
- 5 Click Delete** — Select the Delete link from the options that appear.
- 6 Confirm** — A pop-up dialog will ask for confirmation — click OK to permanently delete the tag.

Deleting a tag does NOT delete the posts that were using it.
Tag deletion is permanent — there is no Trash folder for tags.
Always confirm before deleting, as this action cannot be undone.
