

WordPress Installation

System requirements for WordPress installation

- If you are using Windows, you require installing WAMP (Windows, Apache, MySQL, and PHP).
- If you are using Linux, you require installing LAMP (Linux, Apache, MySQL, and PHP).
- If you are using MAC, you require installing MAMP (Macintosh, Apache, MySQL, and PHP).
- Or you can also install XAMPP, which is Multi-platform and comes with (Apache, MariaDB, PHP, and Perl).
- WordPress is compatible with PHP 5.2+ and MySQL 5.0 +

Download WordPress

WordPress is a free and open-source platform under the GNU General Public License (GPL), and you can download it directly from WordPress's official website. You can also open the <https://wordpress.org/download/> link now to download WordPress.

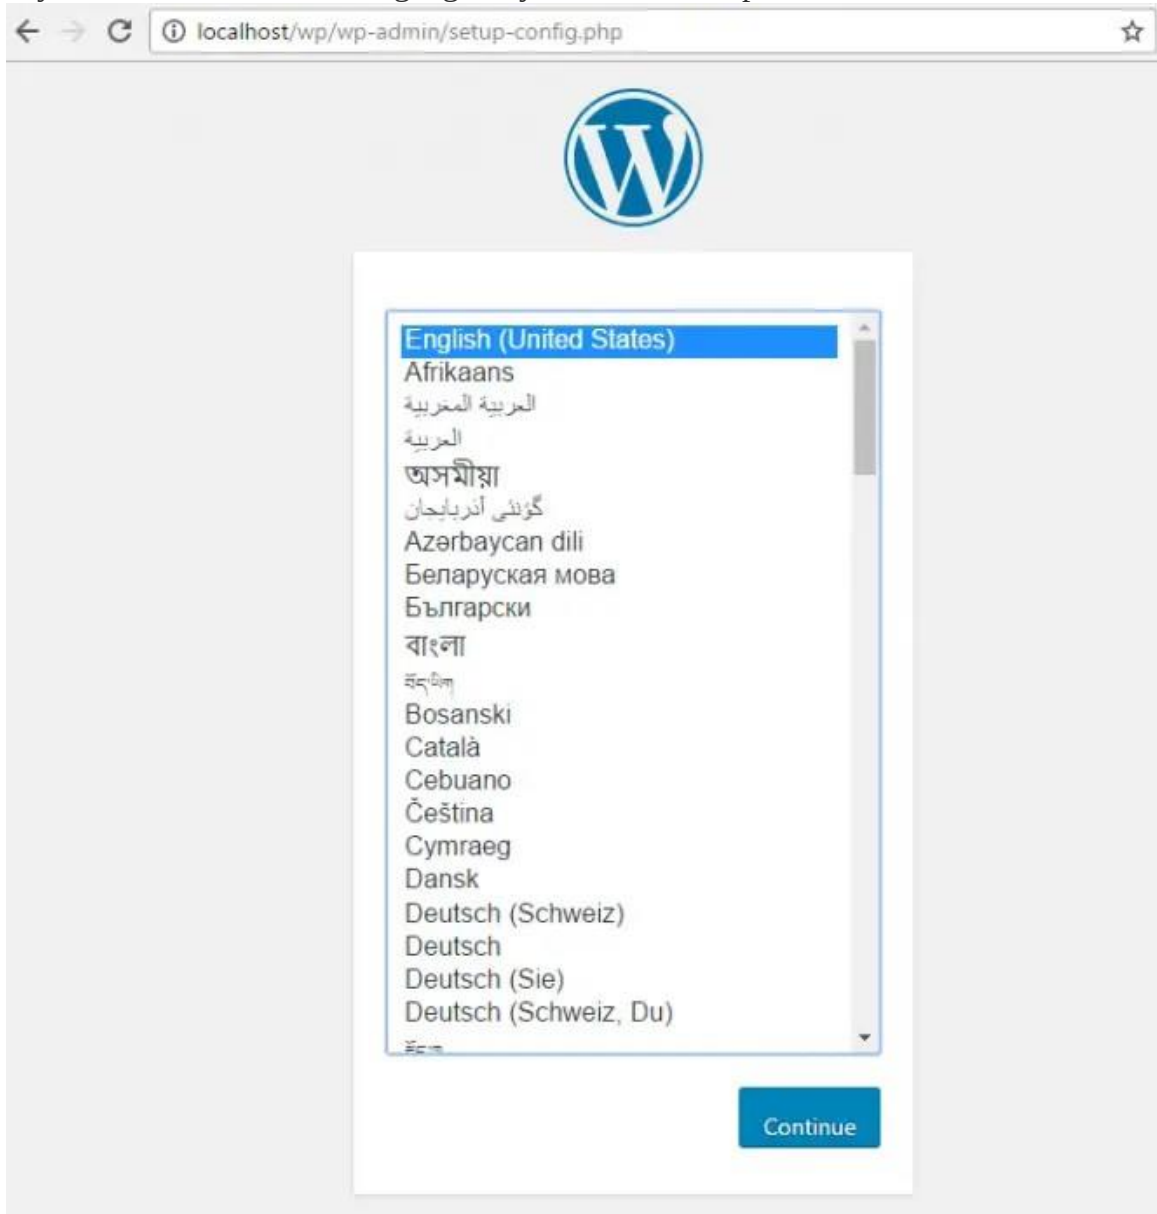

WordPress Installation

- First, you need to download WordPress and upload it into your localhost or web server project folder.
- Then you are required to open your web browser and navigate the URL of the WordPress folder path (In the case of localhost URL will be `http://localhost/wordpress_project_folder_name`).

- Next, WordPress installation requires an empty MySQL dat'abass, so you require to create it before.
- Next, the WordPress Setup wizard will ask you for initial information about the website, which is mentioned below.

St'sp 1: The WordPress installation setup will ask you about your language preference in the first step. Here you have to choose the language of your choice and press Continue.

St'sp 2: The second stage provides the required information before proceeding.

St'sp 3: You must provide MySQL database connection credentials in this installation step. It will ask to enter the information related to the MySQL database. Here is the list of fields that the screen will be asking you to insert:

1. Dat'abass Nams: This will be the name of the database that you have already created in the MySQL database to use WordPress.
2. Ussrnams: It will be the user name data for your database.
3. Password: Here, you must enter your MySQL database's password.

- . Database Host: is where you have to insert the hostname; the default is "localhost".
5. Table Prefix: is implemented to add prefixes in the database tables, which help run multiple sites on the same database.

Below you should enter your database connection details. If you're not sure about these, contact your host.

Database Name	wordpress	The name of the database you want to use with WordPress.
Username	root	Your database username.
Password	password	Your database password.
Database Host	localhost	You should be able to get this info from your web host, if localhost doesn't work.
Table Prefix	wp_	If you want to run multiple WordPress installations in a single database, change this.

Once you provide all the information, press the Submit button.

Step 4: The installation setup checks the authentication of database credentials and provides you with a confirmation.

All right, sparky! You've made it through this part of the installation. WordPress can now communicate with your database. If you are ready, time now to...

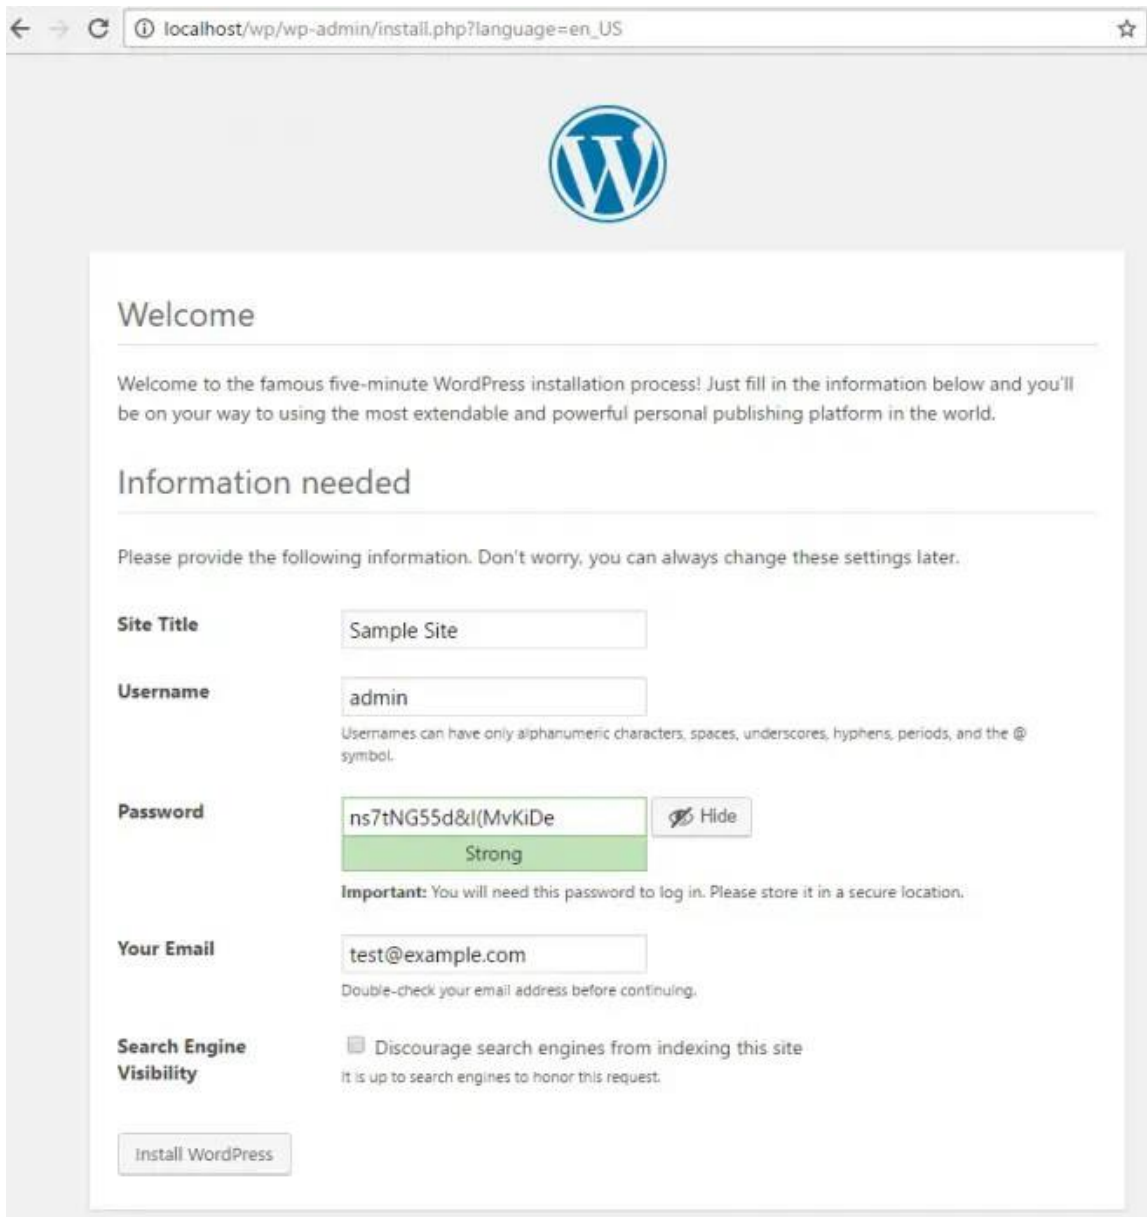

If you have provided the correct MySQL credentials, a new screen will come up with the option "Run the Install".

Click the "Run the Install" button.

Step 5: This is the final step, where you must provide site admin information. Enter the administrative information; the form will have the

following fields:

1. Title of the site
2. Username
3. Password
- . Your Email address
5. Check-box to allow search engines to index the site.

The screenshot shows the WordPress installation process at the 'Information needed' step. The browser address bar shows 'localhost/wp/wp-admin/install.php?language=en_US'. The page features the WordPress logo at the top. Below the 'Welcome' message, it states: 'Welcome to the famous five-minute WordPress installation process! Just fill in the information below and you'll be on your way to using the most extendable and powerful personal publishing platform in the world.' The 'Information needed' section prompts the user to provide details, noting that settings can be changed later. The form includes fields for 'Site Title' (filled with 'Sample Site'), 'Username' (filled with 'admin'), 'Password' (filled with 'ns7tNG55d&l(MvKiDe', marked as 'Strong'), and 'Your Email' (filled with 'test@example.com'). A checkbox for 'Search Engine Visibility' is checked, with the label 'Discourage search engines from indexing this site'. An 'Install WordPress' button is at the bottom.

localhost/wp/wp-admin/install.php?language=en_US

Welcome

Welcome to the famous five-minute WordPress installation process! Just fill in the information below and you'll be on your way to using the most extendable and powerful personal publishing platform in the world.

Information needed

Please provide the following information. Don't worry, you can always change these settings later.

Site Title

Username
Usernames can have only alphanumeric characters, spaces, underscores, hyphens, periods, and the @ symbol.

Password
Strong

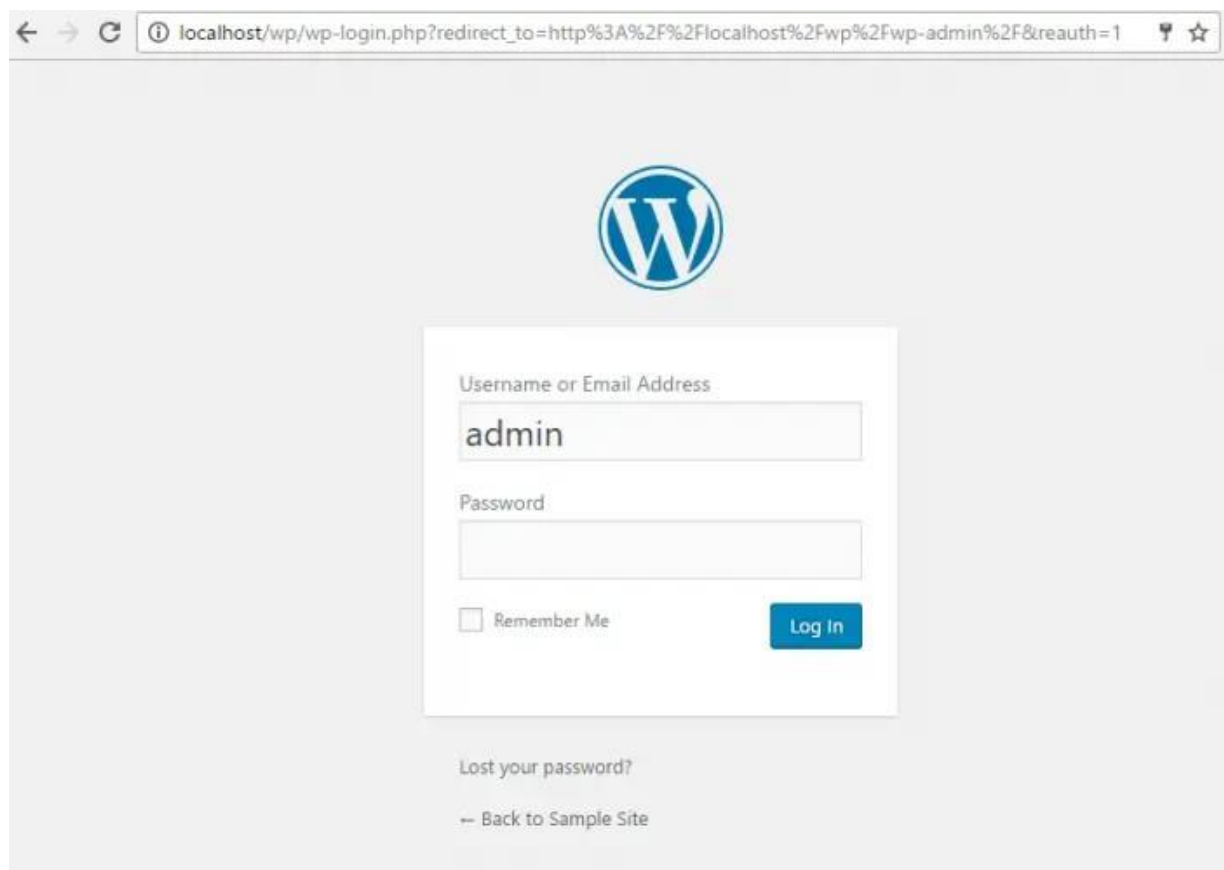

Important: You will need this password to log in. Please store it in a secure location.

Your Email
Double-check your email address before continuing.

Search Engine Visibility ☒ Discourage search engines from indexing this site
It is up to search engines to honor this request.

Once you fill required data in the form, click the "Install WordPress".

St'sp 6: The admin panel will come up with a login screen. Enter the username and password you have chosen on the previous screen and log in.

That's it; you have successfully installed WordPress.
